

REQUEST THE TEST

How do you measure the quality of something you can't see? You may be surprised to learn that many microbial products on the market contain no microbes, too few microbes or microbes different than those claimed on the product label.

Here are four key quality control test reports to request from your supplier to ensure you've made the best purchasing decision.

ENUMERATION TESTING

Are there enough microorganisms in the product to meet the label claim?

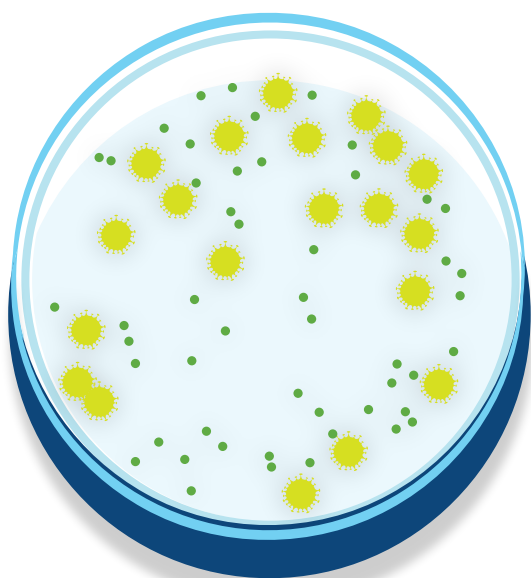

IDENTITY TESTING

Do the microorganisms in the product belong to the correct species as claimed on the product label?

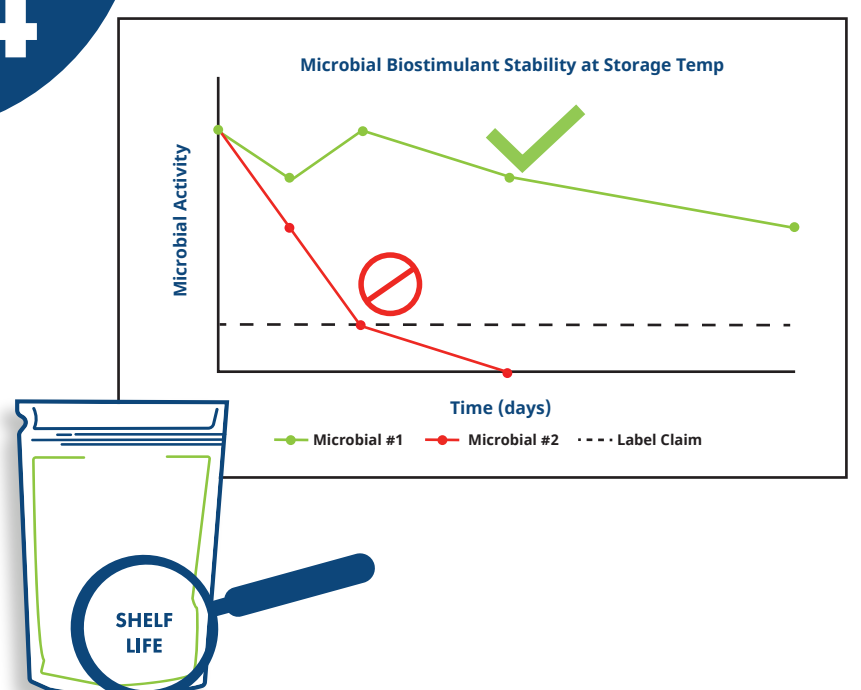

3

CONTAMINATION TESTING

Are there other microbes in the product that aren't claimed on the label and may impact the product's efficacy or safety?

4

STABILITY TESTING

When stored as directed, does the product continue to meet all the criteria listed above for the duration of its shelf life?
